Abstract (en)
[origin: EP0309033A1] The modular internal partition forming a container of the invention is formed by a plurality of uprights and cross-bars (6) connected in the form of a lattice within a perimetral metal profile, which uprights and cross-bars (6) are formed by bearing panels transverse to the extension of the wall, closure panels (7,8,9) and the like, either fixed or movable, supported by the panels of the vertical uprights being disposed between these uprights and cross-bars (6), in which a plurality of shelves, forming a shelving unit designed to receive various materials, may also be disposed between the successive uprights, in which the transverse vertical and horizontal panels (6) are provided on their edges with gaskets sealing them against the closure panels (7,8,9) which gaskets also comprise the reference surfaces for the machining operations on the panels themselves after the gaskets have been assembled.
