Abstract (en)

[origin: EP0309762A2] An adjustable axial piston machine with a swash plate, with a cylinder drum (3), which can rotate in a housing (1) coaxially with respect to the axis of rotation of the machine, with pistons (5), has an adjustable pivoting body (12) which is supported on a supporting surface (19) in the housing (1) with its supporting side (17), located opposite to the effective surface (11). In order to reduce the axial length of the machine and to avoid sliding movements in the pivoting body bearing, it is proposed that the supporting side (17) of the pivoting body (12) and the supporting surface (19) in the housing (1) be provided with interacting contours (18, 19) which, on adjustment of the pivoting body (12), generate rolling movements of the same relative to the supporting surface (19). <IMAGE>
