Abstract (en)

[origin: EP0310518A1] The filing cabinet comprises a frame (10) supporting at least two superposed rows of filing modules (100, 200) mounted on the frame (10) so as to be able to pivot simultaneously by means of at least one connecting rod (34) about parallel horizontal shafts (01, 02). <??>The filing modules (100, 200) are produced so that the upper edge (B2) of the rear wall (216) of a lower filing module (200) comes up against the lower edge (A1) of the front wall (115) of the adjacent upper filing module (100), in the simultaneous opening movement, so as accurately to stop the rotation of the filing modules and to ensure, in the open position, the connection and continuity of the rear wall (216) of the lower filing module (220) with the front wall (115) of the adjacent upper filing module (100). The two walls (216, 115) are then located substantially in line and parallel, such that, in the open position, the total section of the filing volume defined by each filing module (100, 200) appears visible and accessible. <IMAGE>
