Abstract (en)
[origin: EP0311064A1] In order to maintain a predetermined distance between paving blocks (2) and thus to make it possible for the joints (6) to be provided with greenery, spacing elements (1) consisting of concrete or wood have hitherto been used. However, these present serious disadvantages. Concrete spacing elements are too heavy and spacing elements consisting of rottable material, for example wood, do not ensure that the paving blocks (2) remain fixed once they have rotted. To overcome these disadvantages, the new spacing element (1) consists of a T-shaped hollow profile which is made of plastic and is open at both ends. <IMAGE>
