Abstract (en)  
[origin: WO8800115A1] A side element (2) of a plate press is formed by using strips (3) arranged in the shape of a V and mounted elastically and at a distance from one another on the pressure application side. This position is achieved by external junction points (5) at which the pressure strips (3) are held in contact with one another and by intermediate components (4) arranged near said junction points (5). The spaced elastic arrangement of the pressure strips (3) enables them to come together when the press plates (1) are compressed.
