Abstract (en)  
[origin: EP0311730A1] A squeegee (3) for the application of application material such as optionally foamable substances of different viscosities, coating materials, paints, adhesives, pastes or the like onto an application surface, having at least one squeegee capable of being pressed such as a coating squeegee or a roller squeegee (302) is universally applicable and has a compact form of construction, the result of application being capable of adjustment, without exchange of components, over a broad range or very finely and, in particular, and of being modified in a continuous, precise and well-defined manner even during operation of a squeegee machine. To this end, the squeegee (3) is constructed as a profile element (30) which is capable of swivelling about a longitudinal axis (320) determined by the extension of the squeegee and carries the squeegee (302).
