Abstract (en)
[origin: EP0311803A2] In a known extensible table, the mechanism arranged below the table tops cannot be covered by an edge panel since this leads to the insertion boards jamming with the edge panels arranged on the table tops. The extensible table according to the invention has an edge panel which is arranged on the outer edges of the table tops or insertion boards. Due to the edge panels, the mechanism arranged below the table tops is not visible. When the insertion boards are moved into the position of rest, cross-struts which can be coupled on or uncoupled allow a more rapid transverse displacement of the insertion boards which is initially brought about via a cam part when the cross struts are uncoupled and subsequently - as is known - takes place via the rotary movement of the coupled-on cross-struts. A special design of a control rail for displacing the table tops simplifies the production of the mechanism. Extensible table as furnishing article. <IMAGE>
