Abstract (en)  
[origin: EP0313010A1] The buckle for a motor vehicle safety belt system contains a bar (3) for fixing a buckle tongue (10) in the buckle, a pushbutton (6) for opening the buckle, which pushbutton interacts directly or indirectly with the bar (3), and an ejector (4) which expels the tongue (10) from the buckle housing when it has been released. Furthermore, there is provided in the buckle a locking element (12) which, in its position of rest, permits the opening movement of the bar (3), whereas it changes its position if the buckle is subjected to acceleration and thereby locks the bar. During normal operation, the locking element (12) is held in its position of rest by means (14a, 14b) which permit a change in position of the locking element (12) at more than a predetermined acceleration. <IMAGE>
