Abstract (en)

For an electrically operated, hermetically enclosed compressor (2) particularly for use in domestic refrigerators there is provided a novel system for the electric connection of the compressor (2) to the electric circuit of the refrigerator by means of a single support and fixation system (13) on the compressor which may be used for alternatively connecting two different components, one such component being a conventional support adapted to receive only the power supply cables for the compressor, the other component comprising a complete terminal strip (23) to which all the circuits of the refrigerator are connected and which is designed for the automatized mounting thereon of an electric connector.
