Abstract (en)

[origin: EP0313442A1] The invention relates to a device for closing an access orifice (1), especially of a furnishing element, such as a piece of workshop furniture, comprising at least one wing (5) consisting substantially of a rectangular plane plate, a frame (5) comprising at least one rectangular surround (6) delimiting said access orifice (1), means (7) for associating each wing (5) movably with the frame, and means (12) for adjusting the centering of the wing (5) in relation to the surround (6), characterised in that, in the closing position, the means (7) for associating the wing (5) movably with the frame perform only the function of guiding the wing (5), the supporting function being performed fully and solely by the means (12) for adjusting the centering. <IMAGE>
