Abstract (en)

[origin: JPH01122870A] PURPOSE: To enable a user to easily and accurately determine the rupture edge of a film covering the outer surface of a support sheet by fitting a rubbing strip to the free end of an elastically flexural long and narrow support leg, and the edge of this rubbing strip serve as a support sheet pressing edge. CONSTITUTION: When a left edge 14' of a rubbing strip 14 is placed on a substrate, a support leg is completely bent, and a protrusion 7 of the strip 14 abuts an opposed protrusion 8. When the rubbing strip 14 is slid along the substrate, a film 5a covering the outer surface of a support sheet 5 is continuously drawn out by the specified dimension from the support sheet 5. After this drawing out, pressing force from a hand roller is released. Then the support leg 12 is elastically reset, and the stopper 7 is separated from the opposed stopper 8. The whole support sheet 5 is therefore tensed again to increase frictional force, and the film 5 is ruptured. When the hand roller is lifted, the film 5a is ruptured along a new rupture line 29 and stuck to the substrate 17 over the specified dimension.
