Abstract (en)  
[origin: EP0313803A1] An appliance for treating hair is described, having a winding mandril driven by a reversible motor and a hair dryer whose outflow nozzle is arranged perpendicularly to the axis of the winding mandril, and is adjustable in such a manner that the emerging flow impacts at a tangent on the hair wound onto the winding mandril. The direction of rotation of the winding mandril and the position of the outflow nozzle of the hair dryer are coupled to the actuation of the reversing switch for the drive motor in such a manner that the flow impacts on the hair wound on the winding mandril towards the tip of the hair. Reversing is controlled by two switches (1, 2), whereof the first switch (1) is directly actuated by the reversing switch (3) and the second switch (2) is actuated only after a certain time-lag. <IMAGE>
