Abstract (en)
[origin: EP0314006A1] The button has a button web, which is to be attached to the clothing, and a portion which is integral with said button web via a flexible bridge of material and belongs to a button plate. For good stability in use with ease of buttoning and unbuttoning, it is proposed that the bridge (B) of material, bearing the portion (A) and absorbing the buttoning forces, surrounds the button web (2) concentrically and that the portion (A) is constructed as a circumferential bead (11) at the button edge. <IMAGE>
