Abstract (en)

[origin: WO8808952A1] A process and a device for detecting and correcting errors of alignment between gun fire control devices and weapons installations have the following characteristics: target measurement sensors (B) are arranged on guns (G3) with servo-controlled carriages and the line of sight of the measurement sensor is aligned with the line of fire of the gun; the guns, together with their target measurement sensor are aligned on a common measurement target (Z) by a target tracking device (T2); the difference between the position of the measurement target and the position of the line of sight of the target measurement sensor is recorded in the target measurement sensor of the gun controlled by the target tracking device; this difference is evaluated and taken into account by the servo-control of the gun in the correction of control signals emitted during firing.
