Abstract (en)

The invention is primarily directed to sensor modules for mounting directly upon energized electrical power lines to monitor parameters associated with operation thereof, wherein the modules have a more compact lateral configuration than prior art modules designed for the same purpose.

The modules includes a first, cylindrical housing portion (48) containing the sensing means and other electronic data processing and transmitting elements, and a second housing portion (50), affixed to the exterior of the first portion and extending not more than about 150 DEG around the periphery thereof, and enclosing mechanical elements of the module mounting means.
