Abstract (en)
[origin: EP0314894A1] A cutter with a cutter-blade mounting which is guided longitudinally displaceably and is tension spring-loaded in the direction of the hollow cutter handle comprises a stationary holding and guiding element (18) which is displaceably received by the handle sleeve of substantially rectangular shape in cross-section. Side elements (16), which enclose the blade (12) between them, are held against the holding and guiding element (18) under tensile load via a tension spring (31). They are guided longitudinally displaceably via guiding ribs which engage in slots (22, 23) formed on the holding and guiding element (18). One side element (16) is provided with fitting pins (38, 39) which engage in bores (40, 41) of the holding and guiding element (18) in order to fix said side element. <IMAGE>
