Abstract (en)  
[origin: EP0315088A2] A data transmission device comprises memory means for storing a plurality of data consisting of a plurality of kinds of sorting areas and selectively transmits the data of the sorting area including a desired data in response to a predetermined command signal. Accordingly, data of the sorting areas including no desired data may not be sent. And the central processing unit is connected to each of the electronic cash registers through one or more communication lines and when the electronic cash register receives a command signal sent from the central processing unit, the electronic cash register acts according to the command signal. Accordingly, one or a plurality of electronic cash registers can be remote controlled by sending a command signal from the central processing unit.
