Abstract (en)
[origin: WO8809757A1] The present invention relates to an arrangement (1) for a container (3) for compressing refuse (2) and similar material by means of a number of material processing devices (7) for compressing the material and capable of being accommodated in the container (3), which devices are capable of rotating and of moving in a vertical sense relative to the material accommodating container (3). The invention permits, amongst other things, a compacting arrangement to be produced which is simple and is capable of working in a restricted space without requiring great vertical clearance. Said material processing device (7) is supported by a carrier arm (13) extending internally inside the container (3) towards the bottom (3B) of the container and displaced laterally from the centre of the container, on the lower end of which carrier arm there is supported a whirler (14) or some other hydraulic motor for causing the material processing device in question to be driven hydraulically in a rotational sense.
