Abstract (en)
[origin: EP0315722A1] The closure comprises first means (1) whose lower part is in the shape of a U, the arms of the latter being connected by a spindle (2), this lower part forming a passage for a first strand (9), the second strand (10) being articulated to an end (7) of second means (4, 6, 7). The upper part of the first means is in the form of a hook and it permits an articulated link with the second means, comprising a spindle (5) inserted into the groove of the upper part in the form of a hook of the first means (1). The latter comprise a lever (3) which, in a folded or locking position, clamps the part of the first strand (9) which emerges from the passage against the end of the second means to which the second strand (10) is articulated, which fastens and holds the second strand in place. The closure makes it possible to use strands without fixing holes, which contribute to avoiding any risk of these strands breaking. <IMAGE>
