Abstract (en)  
[origin: EP0316046A1] A hospital-type bed to give people nursing care at home comprises a frame (2), a bed section (1) which is made up of segments (1a, 1b) and is fitted so as to be detachable from the frame (2). For moving the bed section (1) in the vertical direction between a low and a high position two lever systems (5-7) are connected to one another by at least one connecting rod (9) and these lever systems (5-7) can be operated by an operating device (15). In order to be able to dismantle the bed in a few minutes into a number of components which can be stacked to give one or more units which can be manoeuvred easily, each lever system (5-7) forms part of a separate segment (1a, 1b) of the bed section (1) and is detachably connected to the frame (2), the connecting rod (9) between the lever systems (5-7) being detachable.
