Abstract (en)  
[origin: WO8809855A1] A seal device for providing a weather seal between an elongate member and a surface through which the elongate member extends, such as a roof or wall of a building or like structure, the seal device comprising an apertured base member (10) of resilient deformable material to be located in use in superimposed relation to the surface with the elongate member extending through the aperture, and a sleeve (11) of resilient deformable material integral with the base member (10) and projecting from one side thereof. The sleeve (11) encompassing said aperture in the base member (10) so that in use the elongate member also extends through the sleeve member (11). A rib (25) formed integral with the sleeve and base members projecting outwardly from the external surface thereof. The rib (25) extending generally down the length of the sleeve and across the base member (10), whereby in use the wall of the sleeve and base member (10) may be slit adjacent to and for the full length of the rib (25) to permit opening of the sleeve and base member for fitment about the elongate member. Clamp means (32) are secured to the sleeve and base member to extend parallel to and for the length of the rib (25) so the slit may be made between the rib and the clamp means. The clamp means (32) being adapted to embrace the rib (25) and be non resiliently deformed to grip the rib and sealably close the slit to secure the sleeve and base member around the elongate member.
