Abstract (en)  
[origin: EP0316590A2] Door fittings can be connected to a long inner and outer plate (4 and 2), a lock cylinder (10) electrically activatable by key actuation, and control electronics connected to the lock cylinder via a cable laid in the door leaf (12) and accommodated in the inner plate (4), especially also in conjunction with a built-in mortise lock with latch bearing and a lock cylinder also having key-actuable mechanical tumblers. So that the control electronics, together with the associated components, can also be installed in the long inner plate (4) in a simple way even at a later date, the latter consists of a baseplate (13) which rests on the door leaf (12) and is screwed firmly to the outer plate (2) and which has the latch bearing and a lock-cylinder perforation, and of an inner-plate cover (14) connected releasably to the baseplate (13), between these being accommodated exchangeably an electronics housing (15, 15') which contains the control electronics (31) and is fastened releasably to the baseplate (13) and which has perforations for the latch bearing and the lock cylinder (10). <IMAGE>
