Abstract (en)

[origin: EP0316921A1] A lead-containing additive for molten steels is in the form of a filled wire consisting of a metallic shell and fine particles of a filling material, which consists of a) metallic lead and/or lead alloys and b) a lime-containing material which releases CO<sub>2</sub> at the temperature of the molten steel. <??>This additive allows reliable, controlled and uniform introduction of lead into the steel.
