Abstract (en)

[origin: EP0317379A1] Packaging device for individual containers, comprising a blank of cardboard, plastic or the like, having a surface pierced with orifices through which the said containers pass and which is grooved along two continuous or interrupted lines delimiting two strips which, after folding, form two short parallel wings or flaps (140) with tabs (135) originating from the cutouts forming the said orifices in the blank and capable of being raised from the latter opposite the wings. <??>The containers (P) - held in the said orifices - are, moreover, supported by means of bearing of the said wings or of the said tabs which then act as supports or braces under an outer projection of the containers and over a zone of small breadth of the projection, the total height of the tabs (135) and of the wings or flaps (140), by means of which the device can rest on a display surface or any appropriate support, being substantially equal to the height of the said containers (P). <IMAGE>
