Abstract (en)
[origin: EP0317731A1] In the operation of a refuse incinerator, the parameters affecting the combustion process are measured as a function of the water content of the refuse, the water content preferably being determined by means of a radiation receiver with downstream evaluation circuits responding to H₂O bands in the spectrum. Evaluation of the spectra over a plurality of zones of the grate allows the air supply and the reduction of pollutants to be optimised. <IMAGE>
