Abstract (en)

[origin: US4903457A] The device comprises control evacuation means (40) mounted substantially level with the envelope inlet into the insertion station (1) and tilting means (43, 44) for tilting the filled envelope, with the tilting means being controlled to take up a low tilting position in which they push down said filled envelope around the inlet to the insertion station, after which it is evacuated. The resulting insertion machine is made compact and is accurately controlled during each insertion cycle by a single driving cam shaft (52, 55) including a coding disk for determining successive angular positions.
