Abstract (en)

[origin: EP0318607A2] A device for the automatic manufacture of a cutting die having a sharp cutting edge, in particular for label cutting appliances, from a cutting body provided with a raised ridge. To avoid the hitherto manual finishing of the ridge produced by etching or in another way, a largely automatically working device is proposed which has a support (6) for the cutting body, a tool (56) with a roof-shaped notch facing the support (6), a first drive device (64) for the automatic reciprocating movement of the tool (56) in the direction of the support (6), and further drive devices (15, 37, 51, 62) intended for producing relative movements between the support (6) and the tool (56), by means of which the tool (56) can be automatically guided along the ridge (22) (Fig. 1). <IMAGE>
