Abstract (en)
[origin: JPH01169137A] PURPOSE: To obtain almost uniform damping characteristic even at a changing inlet pressure by only conducting pressure regulation of the inlet pressure with a valve piston arranged in two valve chambers inside a release valve, to prevent earlier opening of a high inlet pressure. CONSTITUTION: In a release valve 19 of a pneumatic shock absorber connecting with a pressure chamber 13 and a outer pressure source P through a counter current stopping valve 25, the valve chamber 29 is airtightly divided into two chambers 32, 33 by a valve piston 30, the first chamber part 32 connects a duct 20 leading to the pressure space 12 with an outlet path 25, the second chamber part 33 is connected with a pressure space 12 through a duct 21. Therefore, while a high inlet pressure is supplied to the release valve 19 through the counter current stopping valve 25, the pressure is acting on the valve piston 30 besides the spring 39, so as earlier opening is prevented. As a result, as the valve seat 36 is opened corresponding to the position of the piston 10 regardless of the inlet pressure, the release valve 19 has an uniform damping characteristic.
