Abstract (en)
[origin: EP0319361A1] The invention involves measuring the concentration of the bath (2) for each dye constituent contained in the bath by photocalorimetry at specific time intervals, comparing the values obtained with the reference values corresponding to the initial bath and adding a predetermined quantity of a correcting solution when the deviation established for a given constituent reaches a particular threshold. The correcting solution is a concentrated solution if the deviation is negative, that is to say if the bath is depleted, and a dilute solution if the deviation is positive, that is to say if the bath is enriched. <IMAGE>
