Abstract (en)
[origin: EP0319392A1] A heat exchanger, in particular recovery apparatus for heat from smoke, comprises a first set of tubes (1), each tube (1) of which is formed by a succession of parallel straight segments (21-30), connected to one another at each end by a connection loop (31-39), the planes (P1, P2 to Pn) passing through two successive segments (21-30) being inclined alternately on one side and the other in relation to the general plane (P100-P100; P200-P200) of the tube (1) in such a manner that the successive segments are arranged in a staggered manner in relation to the general plane. <IMAGE>
