Abstract (en)
[origin: EP0319465A1] The set of concrete wall stones consists of front (1), anchoring (2) and connecting stones (3). The front stones (1) have a textured front side similar to natural stone and dovetailed projections (5) are integrally formed on their rear side. <??>They are inserted in irregular alternation at a basic width B and also at widths 1.5B and 2B. Another type of front stone is box-shaped and therefore permits planting. The anchoring (2) and connecting stones (3) form distance elements with dovetailed projections (7, 8) opposite one another of the same dimensions as the projections (5) of the front stones. By keying of the front stones (1) with these anchoring (2) and connecting stones (3), double-crowned dry walls of various thickness can be erected on the one hand, and retaining walls which can be secured in the slope by re-linking can be erected on the other hand. <IMAGE>
