Abstract (en)
[origin: EP0319606A1] The invention relates to a fused switch (30) with a housing (31) in which there are arranged in a touching manner at least two electrically insulated housing contacts (32, 33). The one housing contact is electrically conductively connected to an input current connection (34) and the other housing contact is electrically conductively connected to an output current connection (35). In the housing (31), a fuse plug (36), provided with a fuse insert (37), is arranged such that it can pivot between a switched-off position and a switched-on position. In order to simplify the design and to reduce the use of material and the production costs, and in order to achieve a significantly smaller installed width and a small switching play between the housing and the fuse plug it is provided that the fuse plug (37) be guided in a moving manner in its pushed-in limit position directly on the mutually parallel inner walls (38) and on guide elements (40) arranged fixedly thereon. <IMAGE>
