Abstract (en)  
[origin: EP0320961A2] A device for filing developed and/or enlarged photographs of all formats. The essential features of the invention consist in that the photographs are arranged in sheets which have perforations on one side and can be hooked into albums. The sheets which can be hooked into albums are preferably larger than the album in the landscape format and have a fold. The advantages of the invention are, in particular, that album sheets, even of relatively large landscape formats, can be filed without problems in ring binder-type albums. It is also an advantage that the development, enlargement and sticking-in of the photographs ready for the album can be carried out in one transaction at the specialist shop and, finally, facilitate the process for the collector. Additionally, photographs and associated negatives can be situated together on one sheet which can be filed in an album. Using an easily foldable material, the most favourable format in each case of the sheet on which the photographs are stuck can be achieved by simple folding operations. Multiple sticking-in and detachment of the photographs without problems is likewise an advantage of the design according to the invention. In this case, it is helpful that, for example, self-adhesive labels and separation markers can also be sold individually as accessories. <IMAGE>
