Abstract (en)

[origin: EP0321839A2] Bleaching baths and bleach-fixing baths, which contain an iron(III) ion complex salt as bleaching agent and additionally a 5- to 7-membered heterocyclic compound which contains at least one N atom and at least one further hetero atom from the series O, N, S and which is substituted by -S<(-)> and carries a positive charge on the quaternary ring nitrogen atom, arranged in such a way that no tautomeric charge compensation to give a neutral thione form is possible, ensure, due to an excellent bleaching rate and simultaneously good stability, good bleaching in colour materials within the usual processing times, that is to say they ensure blackening without residual silver in colour negative materials and low minimum densities in colour reversal materials.
