Abstract (en)  
The invention relates to an anchor block (1), for instance for supporting an external lighting fitting, a traffic sign or other construction. One of the objects of the invention is to produce an anchor block (1) which is considerably easier to use than the known anchors in combination with the widest possible range of devices. To this end the invention proposes an anchor block (1) of the type stated which is characterized by mounting means for connection to the anchor block of the construction to be supported, in preference an upper surface (10) with a number of mounting slots (12-15) which extend from the centre of the surface (11) in an at least approximately radial direction, for fastening the construction to be supported with screwed connections. Use may for example be made of a first group of mounting slots, which are arranged at angles of approximately 90 DEG to each other, or alternatively a second group of mounting slots which are arranged at angles of approximately 120 DEG to each other, while combinations of both these groups are possible. In this respect preference is accorded to a variant with six mounting slots, whereby the two groups have one mounting slot in common.
