Abstract (en)

[origin: EP0323779A1] The closure (1), intended to be mounted on the neck of a container containing the product, comprises a pipe (5) capable of interacting with the neck. The pipe (5) is closed by a transverse bottom (7) equipped with a nozzle (8) projecting from the side opposite the pipe and communicating with the latter; closing-off means comprise a small plate mounted pivotably about an axis (10), substantially orthogonal to that of the pipe (5), this small plate (9) being capable of closing the nozzle (8) for a closed-off position, whilst passage means comprise a channel (21) provided in the small plate (9) and emerging outside this small plate, this channel (21) communicating with the pipe (5). Opening means comprise a pusher device (24) capable of causing the small plate (9) to pivot about its axis (10) from the closed-off position to an open position. <IMAGE>
