Abstract (en)

[origin: WO8905109A1] A drawer with a guiding mechanism consisting of support rails and body rails has side walls consisting of frames (2) fitted with support rails (5). A front plate (1) of the drawer is secured by retaining angles (19, 20) whose legs (19) parallel to the frame can be adjusted in height by means of eccentrics (23). To permit precise and rapid adjustment of the slope of the front plate in function of the side and the height, with simple means without affecting the inner space of the drawer and at places on the frame which lie close together and are easily accessible when the drawer is slightly open, an intermediate plate is adjustably mounted on the outside of the frame (2). In order to adjust the slope of the front plate (1), the retaining angle pivots in a determinable manner on the intermediate plate (18) about the axis (28) parallel to the front plate. In addition, an adjustment screw (28) is provided for lateral adjustment of the front plate (1). The adjustment eccentrics (23, 32) and the adjustment and clamping screws (25, 28) can be operated from the outer side of the leg (19) of the retaining angle. The whole adjustment device is located in a protected position on the outside of the frame (2).
