Abstract (en)
[origin: EP0324341A2] The heel holder comprises a bar (1), which is arranged swivellably or rigidly on the ski, and an angular, two-armed thrust member (8), whose shorter arm (9) serves as sole holder while the longer arm (10) receives the release mechanism. The latter comprises a spring (12) and a coupling (21), which is provided at the upper end of the thrust member (8). The coupling is swivellable in relation to the thrust member and is held in its effective position by a spring (27), in which a base part (22) of the coupling (21) is locked with the bar (1). The coupling (21) has a swivellably mounted actuating member (29) which interacts with a sloping surface (38) at the upper end of the thrust member. By pressure on the actuating member (29), the latter slides along the sloping surface (38) and causes a swivelling of the coupling (21) in relation to the thrust member (8), by which means the coupling (21) is released from the bar (1). <IMAGE>
