Abstract (en)
Apparatus for sealing roller blinds which comprises first and second housings (18,18 min) which are secured and sealed along the length of respective sides of a window frame and which include respective channels (24) in which the side edges of the roller blind are located when the blind is unrolled. The two housings (18,18 min) include mechanisms for releasably sealing the respective side edges of the blind along the length of the channels (24) and for keeping the blind taut. Each channel includes a rotary wedge (30,34) which enables the width of the channels (24) to be selectively reduced for gripping and sealing the side edges of the blind.
