Abstract (en)

A device to support a workpiece (W) being bent by a bending machine such as a press brake. The rising angle (α) of a table on which the workpiece is mounted is made smaller than that (β) of an arm (14) which raises the table at the beginning of the bending work, though the two angles are again made the same at the work. The workpiece (W) which curves convexly swelling upwards at the beginning of the work can be supported well by the table throughout the bending work.
