Abstract (en)

[origin: EP0325968A2] On the circumference of the support of the apparatus, projections having arcuate projections which fit positively into the opening are arranged at angular distances of 120 DEG , one of the latter projections being resiliently adjustable in the radial direction with the aid of a wedge-shaped pressing. The device is used to compensate mechanical play between an interchangeable support of an apparatus and a base-plate, particularly in sample changers for X-ray diffractometers. <IMAGE>
