Abstract (en)
[origin: EP0325985A1] In a ceiling with a suspended supporting frame comprising longitudinal and transverse supporting rails (10, 26) which cross one another and are approximately T-shaped in cross-section, it is proposed to connect the rails to one another in abutment at the crossing points in that the T-profile of each supporting rail possesses a hollow longitudinal space (12) in the vertical main web (11), and to insert separate connecting elements (21), of likewise general T-shaped configuration, with their central holding web into the hollow longitudinal space (12) of a first supporting rail (26) and to fasten at least one of the base webs (23a, 23b) of the connecting element (21) externally to the vertical main web (11) of a supporting rail (10) extending transversely thereto. <IMAGE>
