Abstract (en)
[origin: EP0326495A1] The device is formed from two superimposed straps and constituted from two identical sliders (5) disposed in the reverse direction with respect to each other on the ends opposite to the means of closure of the belt. Each of the sliders (5) is constituted by at least a part formed from a flattened ring (2) having an upper edge which is wider than the lower edge, than the other one, in order to produce an opening having a thickness equivalent to that of the strap, this ring (2) extending at its upper edge by a tongue (3), this tongue (3) allowing the insertion and gluing of each of the sliders (5) in each of the straps (6, 7). In the case in which this part (8) is metallic, it constitutes the sole component part of the slider (5). If this part (8) is made of rigid plastic, it is enclosed in a metal part (1) in the form of a flattened ring having shape and dimensions corresponding to those of the flattened ring (2). <IMAGE>
