Abstract (en)  
[origin: EP0327175A1] In known turning knobs, an adapter and a universal joint piece are arranged between a basic body of the turning knob and a switch grip which can be connected thereto, in order to compensate positional deviations between longitudinal axes of the basic body and an actuating shaft of a control apparatus or the like. The new turning knob is to be capable of simple production and installation, and satisfactory compensation of positional deviations. <??>The switching grip (29) can be connected to the basic body (5) in a manner such as to be substantially fixed for rotation, and the basic body (5) has a bearing piece with locking means (19) for connection to a housing part (3). <??>The turning knob can be used, for example, on the fronts or consoles of household appliances or the like for operating program control appliances or the like. <IMAGE>
