Abstract (en)
[origin: EP0328088A2] The invention relates to a reflector lamp having a plurality of light-emitting diodes, which are arranged in a two-dimensional distribution and are each arranged at the centre of a reflecting surface. A housing whose front side forms the associated reflecting surface is provided for each light-emitting diode, the housings being arranged in a frame combined to form a block consisting of one or more rows, which frame forms adjacent to the reflecting surfaces a circumferential, raised reflecting surface through which light emerging laterally from the light-emitting diodes and reflected from the reflecting surfaces is radiated essentially perpendicularly. <IMAGE>
