Abstract (en)

A stabiliser for the lower end of a ladder (13) comprises a rigid, generally flat base plate (10) and one or more aligned linear projections (11) extending upwardly from the upper surface of the base plate (10), the overall length of the projections (11) being at least sufficient to engage the base of the ladder (13), and the lower surface of the base plate (10) being of enhanced frictional value. For example, the base plate may have rubber pads (12) secured to its lower surface or it may be enclosed in rubber.
