Abstract (en)  
[origin: EP0329931A2] Electromechanically operating door-locking apparatuses are provided with a locking cylinder (7) which is built into a door lock, to be actuated by means of mechanically and electronically coded keys (8), which can also be included in a cylinder locking apparatus, and is connected to a corresponding electronic system (SE), a programming unit (9) serving for programming the electronic system (SE) and the keys (8) also being present, said programming unit (9) to be connected via a multi-conductor connecting cable (12) to a plug connection point (13) leading to the electronic control unit (SE). In order to ensure that a programming or reprogramming of the electronic system (SE) and of the keys (8) cannot be performed from the outside but rather only with the door unlocked or opened, the plug connection point (13) for the programming unit connection cable (12) is arranged on the protected inside of the door (1). If the electronic system (SE) is located in a door lock inner fitting (6) arranged on the door leaf (1), the plug connection point (13) is arranged directly on the door lock inner fitting (6), in particular on its underside. <IMAGE>
