Abstract (en)

[origin: EP0329939A2] Apparatuses for applying liquids have plastic bristles which are grouped into bundles and are fixed to a plastic bristle bearer by a thermal melt connection in such a way that, within the bundle, at least one channel is formed which tapers towards the bristle ends and extends an exit opening, arranged in the bristle bearer, for the medium into the region of the bristle ends. Such apparatuses are produced simply and cost-effectively due to the fact that a riser tube, adjoining the exit opening and projecting into the channel in the bristle bundle, is produced by thermal melting and shaping of the bristles and/or the bristle bearer.
