Abstract (en)
[origin: EP0330208A1] The single-piece blank is made of foldable material to form a tray, which is rectangular or square in contour, for receiving beakers or the like. For the self-supporting construction of this tray and for reducing the consumption of material, inter alia the following features are proposed. At least one support wall is provided in both perforated panels. Said support wall (15) can in each case be swivelled out of a first recess (7) in the perforated panel. The support web (10), assigned to said support wall, can be swivelled out of a second recess which is directly adjacent to the first recess mentioned. The free end of each stack support (11) has a supporting bearing edge (12). When the tray has been set up, the bearing edges mentioned and the free edges of the support walls have approximately the same height. <IMAGE>
