Abstract (en)  
[origin: EP0330880A2] In a washing-product dispenser with water guide channels 9, 10, 13 and 19 to 22 made in the cover 1 of the housing above each washing- product chamber and having a first inflow portion 9 or 10 and, at its end, at least two following further portions 19 and 21 or 20 and 22 which extend parallel to the first portion, but through which the flow passes in the opposite direction, at the end of the first channel portion is arranged a wedge 27, the tip 28 of which is directed towards the stream of the inflowing water. A steadying of the water flow is thereby possible in the region of the channel branch portion 30. Air bubbles carried along are thus no longer set in noise-intensive vibration. <IMAGE>
